

Bearings, Slides & Lubricants

fly-by-wire system can achieve fuel savings in the region of one million litres over its operating lifetime.

The aviation industry has faced its fair share of dissension over its contribution to climate change in recent years. However, both flight operators and aerospace manufacturers are consistently working harder to turn this perception on its head. Helped by the evolution of environmentally friendly component parts, plane manufacturers have estimated that they

can achieve a 20-25 percent efficiency improvement in aircraft by 2020. Perhaps most importantly, this takes them one step closer to the long term goal of developing a zero carbon dioxide emission aircraft, which is now thought to be attainable within the next 50 years. Ultimately, this also allows the aviation industry to grow and gives consumers and businesses the freedom to travel, while also remaining environmentally responsible.
